SUPERNOVA IN IC 3112

The supernova in IC 3112 (RA = $12^{\text{h}}15^{\text{m}}18^{\text{s}}$, Decl. = $+26^{\circ}18'6''$, 1950.0) was discovered on the plate taken at the Crimea-station on 19th February 1963 (U. T. $23^{\text{h}}20^{\text{m}}6^{\text{s}}$). The supernova is situated $10''$ east and $18''$ south of the nucleus. The blue magnitude is $15^{\text{m}}.8$. According to Dr. W. J. Luyten's private communication the supernova is visible on Palomar plate taken on the early morning of 1 March 1963. The red magnitude is about 16^{m} . On the Crimea plates taken on 1 February and 30 March the supernova is invisible (plate limit about 17^{m}).
