THE PHOTOMETRIC ACTIVITY OF RU Cam  
DURING THE YEARS 1970-72

We give here the preliminary results of the systematic monitoring of the variable RU Cam performed at the Merate Observatory during the intervals September 1970-March 1971 and November '71 - July '72.

The Figure displays the increase of the amplitude of the V light curve with a first maximum in January '71, followed by a strong decrease and a second maximum in December '71 after which the decrease of the light fluctuation appears slower.

The variability looks like that of the previous years with a total amplitude of  $0^m.2$  at the most. (Astron. and Astrophys. 18, 201, 1972). The period of the light variation seems constant along the interval 1971-72.
