NEW BRIGHTENING OF V1143 Ori

The fuor-like object V1143 Ori found by Sugano (Marsden, 1983) and Natsvlshvili (Natsvlshvili, 1984) had several brightenings during 1982 - 1986 (Parsamian and Gasparian, 1987; Mirzoyan et al., 1988; Gasparian et al., 1987). The photographic magnitude of V1143 Ori at minimum is about 18^m.

A new brightening of V1143 Ori ($m_{pg} = 15.6$) was detected in October 11, 1989. The observations were carried out on the 21" Schmidt telescope of Byurakan observatory.
